

How to test for Xylazine

IV Users Guide

Lower Your Risk of Overdose

Be Careful

- Go slow by taking smaller amounts
- Use with people you trust and inject at different times
- Have Naloxone available and know how to use it

Step 1: Testing Cooker Residue

Prepare Shot

- Prepare your shot as normal and set aside the needle to test your substance left over in the cooker before injection
- Add enough water to fill your cooker. Stir if necessary

Step 2: Testing

Use the Test Strip

- Place the test strip wavy side down in the water for 15s. Make sure the water is up to the line
- Remove strip from water and place it on a flat surface for 1-2 minutes

Step 3: Results

Read the Results

- A test **POSITIVE** for xylazine is indicated by **ONE RED LINE**
- A test **NEGATIVE** for xylazine is indicated by **TWO RED LINES**
- Remember, no test is 100% accurate, & a negative test does not necessarily mean you are safe

NOTE: It should be considered a **NEGATIVE** test even if a second red line is faded or faint
If possible, use an additional test to confirm your results
